OCCUR=2

[1] Based on 4.7 fb^{-1} of data at LHC7. No signal is found for the search of heavy quark pair production that decay into W and a b quark in the events with a high p_T isolated lepton, large $\not\!\!E_T$ and at least 3 jets ($\geq$ 1 b-tag). Vector-like quark of charge 2/3 with $400 < m_{t'} < 550$ GeV and B($t' \to W b$) > 0.63 is excluded at 95% CL.

NODE=Q009TPP;LINKAGE=AG

[2] Based on 1.04 fb^{-1} of data at LHC7. No signal is found for the search of heavy quark pair production that decay into W and a quark in the events with dileptons, large $\not\!\!E_T$, and $\geq$ 2 jets.

NODE=Q009TPP;LINKAGE=GA

[3] Based on 1.04 fb^{-1} of data in pp collisions at 7 TeV. AAD 12C looked for $t'\overline{t}'$ production followed by t' decaying into a top quark and X, an invisible particle,in a final state with an isolated high-P$_T$ lepton, four or more jets, and a large missing transverse energy. No excess over the SM ttbar production gives the upper limit on $t'\overline{t}'$ production cross section as a function of $m_{t'}$ and m_X. The result is obtained for B($t' \to W t$) = 1.

NODE=Q009TPP;LINKAGE=AD

[4] Based on 5 fb^{-1} of data at LHC7. CHATRCHYAN 12BH searched for QCD and EW production of single and pair of degenerate 4'th generation quarks that decay to $W b$ or $W t$. Absence of signal in events with one lepton, same-sign dileptons or tri-leptons gives the bound. With a mass difference of 25 GeV/c^2 between $m_{t'}$ and $m_{b'}$, the corresponding limit shifts by about $\pm$20 GeV/c^2.

NODE=Q009TPP;LINKAGE=CT

[5] Based on 5.0 fb^{-1} of data at LHC7. CHATRCHYAN 12P looked for $t'\overline{t}'$ production events with two isolated high p_T leptons, large $\not\!\!E_T$, and 2 high p_T jets with b-tag. The absence of signal above the SM background gives the limit for B($t' \to W b$) = 1.

NODE=Q009TPP;LINKAGE=CH

[6] Based on 1.04 fb^{-1} of data at LHC7. No signal is found in the search for pair produced heavy quarks that decay into W boson and a b quark in the events with a high p_T isolated lepton, large $\not\!\!E_T$ and at least 3 jets ($\geq$ 1 b-tag).

NODE=Q009TPP;LINKAGE=GD

[7] Based on 5.0 fb^{-1} of data at LHC7. CHATRCHYAN 12BC looked for $t'\overline{t}'$ production events with a single isolated high p_T lepton, large $\not\!\!E_T$ and at least 4 high p_T jets with a b-tag. The absence of signal above the SM background gives the limit for B($t' \to W b$) = 1.

NODE=Q009TPP;LINKAGE=CA

[8] Based on 5.7 fb^{-1} of data in $p\overline{p}$ collisions at 1.96 TeV. AALTONEN 11AH looked for $t'\overline{t}'$ production followed by t' decaying into a top quark and X, an invisible particle, in the all hadronic decay mode of $t\overline{t}$. No excess over the SM ttbar production gives the upper limit on $t'\overline{t}'$ production cross section as a function of $m_{t'}$ and m_X. The result is obtained for B($t' \to X t$) = 1.

NODE=Q009TPP;LINKAGE=TN

[9] Based on 5.6 fb^{-1} of data in ppbar collisions at 1.96 TeV. AALTONEN 11AL looked for ℓ + $\geq$4j events and set upper limits on $\sigma(t'\overline{t}')$ as functions of $m_{t'}$.

NODE=Q009TPP;LINKAGE=ON

[10] Based on 4.8 fb^{-1} of data in $p\overline{p}$ collisions at 1.96 TeV. AALTONEN 11O looked for $t'\overline{t}'$ production signal when t' decays into a top quark and X, an invisible particle, in ℓ + $\not\!\!E_T$ + jets channel. No excess over the SM ttbar production gives the upper limit on $t'\overline{t}'$ production cross section as a function of $m_{t'}$ and m_X. The result is obtained for B($t' \to X t$) = 1.

NODE=Q009TPP;LINKAGE=LT

[11] Based on 5.3 fb^{-1} of data in $p\overline{p}$ collisions at 1.96 TeV. ABAZOV 11Q looked for ℓ + $\not\!\!E_T$ + $\geq$4j events and set upper limits on $\sigma(t'\overline{t}')$ as functions of $m_{t'}$.

NODE=Q009TPP;LINKAGE=AB

[12] Searches for pair production of a new heavy top-like quark t' decaying to a W boson and another quark by fitting the observed spectrum of total transverse energy and reconstructed t' mass in the lepton + jets events.

NODE=Q009TPP;LINKAGE=AA

[13] HUANG 08 reexamined the t' mass lower bound of 256 GeV obtained in AALTONEN 08H that assumes $B(b' \to q Z) = 1$ for $q = u$, c which does not hold when $m_{b'} < m_{t'} - m_W$ or the mixing $\sin^2(\theta_{b t'})$ is so tiny that the decay occurs outside of the vertex detector. Fig. 1 gives that lower bound on $m_{t'}$ in the plane of $\sin^2(\theta_{b t'})$ and $m_{b'}$. NODE=Q009TPP;LINKAGE=HU

t' mass limits from single production in $p\overline{p}$ and pp collisions

OCCUR=2

[14] Based on 5.4 fb^{-1} of data in ppbar collisions at 1.96 TeV. ABAZOV 11F looked for single production of t' via the Z or E coupling to the first generation up or down quarks, respectively. Model independent cross section limits for the single production processes $p\overline{p} \to t' q \to (W d)q$, and $p\overline{p} \to t' q \to (Z d)q$ are given in Figs. 3 and 4, respectively, and the mass limits are obtained for the model of ATRE 09 with degenerate bi-doublets of vector-like quarks. NODE=Q009TPS;LINKAGE=AB
